Title: Perfect score: Sequence:

Run on: OM nucleic

1

nucleic search, using sw model

GenCore version 5.1.3 Copyright (c) 1993 - 2002 Compugen

Scoring table:

Database

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Post-processing: Minimum Match Maximum Match Listing first Minimum DB seq length: 0 Maximum DB seq length: 50 Total number of hits satisfying chosen parameters: em_htg_vrt:*

                                                       in the preprocessed mRNA. The antisense compound is Rnase inactive, and is preferably a phosphorodiamidate-linked morpholino oligonucleotide. Such targeting is effective to inhibit natural mRNA splice processing, produce splice variant mRNAs, and inhibit normal expression of the protein. The present sequence is an antisense sequence described in the exemplification of the invention.
                                                                                                                                                                                                                                     The present invention relates to antisense compositions targeted to an mRNA sequence for a selected protein, at a region having its 5' end from to about 25 base pairs downstream of a normal splice acceptor junction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         in the preprocessed mRNA. The antisense compound is Rnase-inactive, and is preferably a phosphorodiamidate-linked morpholino oligonucleotide. Such targeting is effective to inhibit natural mRNA splice processing, produce splice variant mRNAs, and inhibit normal expression of the protein. The present sequence is an antisense sequence described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                  Claim 37; Page 23; 53pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to antisense compositions targeted to an mRNA sequence for a selected protein, at a region having its 5' end from 1 to about 25 base pairs downstream of a normal splice acceptor junction in the preprocessed mRNA. The antisense compound is Rnase-inactive, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              04-MAY-2001; 2001WO-US14410

                                                                                                                                                                                                                                                                                      This invention describes a vector containing a recombinase gene which is controlled by (1) a promoter and action of which is in turn dependent on a specific transcription factor and (2) a desired gene to be expressed and two target sequences of the recombinase. Also described in the invention are (i) a host cell for introduction of the vector and (ii) an in vitro technique in which killing of cells without the specific transcription factor is selectively performed after the vector is introduced into a host cell by an in vitro technique. The technique is used for gene therapy e.g. in cancer treatment. The products of the invention allow the use of a specific vector specifically and safely, there is little toxicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI;

The PCR prod. can be used in an assay to directly assess whether a germ-line mutation in a gene which is a transcriptional regulator results in the prodn. of a non functional gene. This may be used in screening individuals at risk of cancer or in cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Assay for mutations in a transcriptional regulator gene - using cells transfected with the gene and DNA encoding a detectable protein expressed in response to the gene

The composition comprises a sequence encoding all or part of p53 and at least one sequence encoding all or part of a cytotoxic polypeptide. These sequences are under control of suitable expression elements. There is a synergistic increase in activity when p53 and the cytotoxic polypeptide are used together, with improved presentation of antigens and/or stimulation of the host's immune cells. The composition is used for the induction and activation of an immune response specific for tumours or virus-infected cells, or inhibition of growth and division (preferably killing) of such cells. The composition is used to treat or prevent tumours (or other proliferative diseases, e.g. restenosis) and viral infections (e.g. caused by hepatitis B or C, herpes of human immune deficiency virus), in humans and animals. PCR primers AAC86956-57 were used to amplify a fragment of DNA encoding p53

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAL42028/c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention comprises variant Trichoderma reesei endoglucanase III (BGIII) cellulases which are more resistant to temperature stress than wild type EGIII cellulase. The variant EGIII cellulases of the invention are useful in the treatment of a cellulase containing textile, the treatment of wood pulp, in the reduction of blomass to glucose, stone washing of indigo dyed denim, and as a feed additive. The present nucleotide sequence represents a mutagenic PCR primer used in the production of a variant EGIII cellulase of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mutagenic PCR; primer; H4 variant EGIII cellulase; wood pulp treatment; biom
                                                                                                            The invention comprises variant Trichoderma reesei endoglucanase III (EGIII) cellulases which are more resistant to temperature stress the wild type EGIII cellulase. The variant EGIII cellulases of the invention to the control of the invention of the invention of the control of the invention of

AC CETP 1
AX ANT50595-T50642 represent target sequences for the human cholesterol CC ester transfer protein (CETP) hairpin ribozymes (see ANT50547-T50594). CC CETP is a 74 kD glycoprotein that facilitates neutral lipid transfer cC between plasma lipoproteins. The numbering of the targets refers to the position of the cleavage site in full length CETP. The ribozyme then cC ribozymes are able to cleave mRNA from the gene encoding CETP, thereby CC blocking synthesis and/or expression of the mRNA. By inhibiting CETP, certain the reverse cholesterol transport (RCT) pathway can be inhibited (or CC elaminated) thereby preventing the reduction in size density of the high cC density lipoproteins (HDL), prolonging HDL half life, and therefore associated with abnormal levels of CETP, specifically atheresclerosis. CC peripheral vascular disease, hyperbetallpoproteinaemia, dyslipidaemia, complications of diabetes, transplant, atherectomy and angioplastic complications (LDL), and the HDL:LDL ratio are favourably altered (a decrease in LDL levels, and a corresponding increase in HDL levels). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              БР
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     δ

AAT50699-T50754 represent target sequences for the rabbit cholesterol ester transfer protein (CETP) hairpin ribozymes (see AAT50643-T50639). CETP is a 74 kD glycoprotein that facilitates neutral lipid transfer between plasma lipoproteins. The numbering of the targets refers to the position of the cleavage site in full length CETP. The ribozyme then binds to 4-6 nucleotides 5', and a variable number 3' of this site. The ribozymes are able to cleave mRNA from the gene encoding CETP, thereby blocking synthesis and/or expression of the mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway can be inhibited (or eliminated) thereby preventing the reduction in size density of the high density lipoproteins (HDL), prolonging HDL half life, and therefore associated with abnormal levels of CETP, specifically atherosclerosis, specifically atherosclerosis, specifically atherosclerosis, specifically atherosclerosis, specifically atherosclerosis, specifically atherosclerosis, peripheral vascular disease, hyperbetalipoproteinaemia, dyslipidaemia, familial hypercholesterolaemia, hypoalphalipoproteinaemia, vascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ribozymes can also be used diagnostically to study genetic drift and mutations in diseased cells, and to detect CETP mRNA. As the ribozymes target specific regions of the CETP gene, they have low non-specific activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           or regression of vasc

                                    cultured natural killer (NK) cells. The NK cells are purified by partial purification through a nylon wool column followed by removal of the CD3+ and CD5+ cells by incubating in the presence of bound anti-CD3 and anti-CD5 antibodies. The remaining cells which express the Leullc+ (CD16) and Leul9 markers are enriched by propagating in a medium containing an agent e.g. interleukin (IL)- 2 which promotes proliferation of the NK cells and in the presence of the NK cells' target cell type e.g. allogenic lymphoblastoid cells. Confirmation of the correct NK cell type is carried by PCR amplification of the CD3 and T-cell receptor (TCR) markers alpha, beta, gamma and deita, on reverse transcribed RNA isolated from the NK cells. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      complications of diabetes, transplant, atherectomy and angioplastic restenosis. By inhibiting CETP, the levels of HDL and low density lipoproteins (LDL), and the HDL:LDL ratio are favourably altered (a decrease in LDL levels, and a corresponding increase in HDL levels) ribozymes can also be used diagnostically to study genetic drift and mutations in diseased cells, and to detect CETP mRNA. As the ribozy target specific regions of the CETP gene, they have low non-specific

CC CETP is a 74 kD glycoproteins. The numbering of the targets refers to the C position of the cleavage site in full length CETP. The ribozyme then CC binds to 4-6 nucleotides 5', and a variable number 3' of this site. The CC ribozymes are able to cleave mRNA from the gene encoding CETP, thereby CC blocking synthesis and/or expression of the mRNA. By inhibiting CETP, CC the reverse cholesterol transport (RCT) pathway can be inhibited (or CC density lipoproteins (HDL), prolonging HDL half life, and therefore increasing HDL levels. The ribozymes can be used to treat conditions CC associated with abnormal levels of CETP, specifically atherosclerosis, CC peripheral vascular disease, hyperbetalipoproteinaemia, dyslipidaemia, complications of diabetes, transplant, atherectomy and angioplastic CC restenosis. By inhibiting CETP, the levels of HDL and low density CC ribozymes can also be used diagnostically to study genetic drift and CC untations in diseased cells, and to detect CETP mRNA. As the ribozymes CC activity.
                                                                                                                                      밁

                                 Ş
                                                                                                                                                             AAT50699-T50754 represent target sequences for the rabbit cholesterol
CC ester transfer protein (CETP) hairpin ribozymes (see AAT50643-T50698).
CC CETP is a 74 kD glycoproteins that facilitates neutral lipid transfer
CC between plasma lipoproteins. The numbering of the targets refers to the
CC position of the cleavage site in full length CETP. The ribozyme then
CC binds to 4-6 nucleotides 5', and a variable number 3' of this site. The
CC ribozymes are able to cleave mRNA from the gene encoding CETP, thereby
CC blocking synthesis and/or expression of the mRNA. By inhibiting CETP,
CC the reverse cholesterol transport (RCT) pathway can be inhibited (or
CC eliminated) thereby preventing the reduction in size density of the high
CC density lipoproteins (HDL), prolonging HDL half life, and therefore
CC increasing HDL levels. The ribozymes can be used to treat conditions
CC associated with abnormal levels of CETP, specifically atherosclerosis,
CC emplications of diabetes, transplant, atherectomy and angioplastic
CC complications of diabetes, transplant, atherectomy and angioplastic
CC complications (LDL), and the HDL:LDL ratio are favourably altered (a
CC decrease in LDL levels, and a corresponding increase in HDL levels). The
CC decrease in LDL levels, and a corresponding increase in HDL levels). The
CC decrease in LDL levels, and a corresponding increase in HDL levels). The
CC decrease in LDL levels, and a corresponding increase in HDL levels). The
CC decrease in LDL levels, and a corresponding increase in HDL levels). The
CC decrease in LDL levels, and to detect CETP mRNA. As the ribozymes
CC decrease in LDL and to detect CETP mRNA. As the ribozymes
CC decrease in LDL and to detect CETP mRNA. As the ribozymes
CC decrease in LDL and to detect CETP mRNA. As the ribozymes
CC decrease in LDL and to detect CETP mRNA.

                                                                                                                                                                                                                                                                                                                                                                                   containing the core nucleotide sequence from the B segment of the human beta-3-AR regulatory region provide a substrate for high throughput assays, particularly reporter gene assays to identify compounds capable of increasing or decreasing the level of expression or beta-3-AR. The nucleotide sequences can be used for regulating gene expression and for drug screening. It is envisaged that beta-3-AR stimulation may have beneficial effects in the treatment of obesity and type II diabetes. The present sequence represents a PCR primer for the human beta-3-AR promoter, which is used in an example from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for detecting non-responders to anti-tumour necrosis factor (TNF) therapy. The method involves testin an individual for homozygosity for at least one single nucleotide polymorphism (SNP) in the gene coding for TNF receptor II, which is located on chromosome 1p36. Two novel SNPs, one in exon 2 (position 168 A/G) and one in exon 6 (position 587 T/G) which result in Lys56Lys and wet196Arg respectively, are also described. The method of the invention in suseful for detecting non-responders to anti-TNF therapy such as inflammatory, malignant or other chronic diagnostic purposes in inflammatory, malignant or other chronic diagnostic The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting non-responders to anti-numan necromprises testing an individual for homozyg nucleotide polymorphism in the gene coding

                                                                                                                              This sequence represents a PCR primer used in an example of the invention. The invention relates to a cancer suppressor gene, which is down regulated in large intestine cancer. The gene is located on chromosome 14932. The invention also relates to a vector comprising the gene, a host cell transformed by the vector, and a process for culturing the host cell and recovering the expression product. The gene, encoded cancers particularly large intestine cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ъ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  δÃ

Sequences ABA02205-ABA02282 represent antisense oligonucleotides (C/EBP alpha) gene, which inhibit its expression. The antisense oligonucleotides vere designed to target different regions of the human C/EBP alpha RNA, and were analysed for their effect investigation on mouse C/EBP alpha expression was performed using a to mouse C/EBP alpha expression was performed using a tomouse C/EBP alpha mRNA. The C/EBP family of proteins are a family of transcription factors which regulate the expression of wide range of
                                                                                                                                                                                                                                                                                        Claim 1; Column 42; 44pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      genes that control normal tissue development, cellular function, cellular proliferation and functional differentiation. C/EBP alpha (also known as CEBPA) is primarily found in tissues involved in energy metabolism which have a capacity to metabolise lipids, cholesterol and other sterols. It is thought to be involved in the regulation of adipocyte and chondrogenic differentation, and is also involved in follicular development and ovulation, steroid-induced cell cycle arrest in the liver, in controlling glucose transporter GLUTZ promoter activity, in the hormonal regulation of metabolism, and in granulocyte development. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with C/EBP expression,
                                                                                                                                                                                                           Human calcitonin 15.18 and encoding polynucleotide, used in diagnosis and treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and inflammation -
                                                                                                              The present invention relates to human calcitonin 15.18 (see ABB75631). The calcitonin protein and its coding sequence are useful for the diagnosis and treatment of foetal abnormality, autoimmune disease, tumours, and for the study of human ageing.
                                                                                                                                                                                                                                                                                                 Mao

The amplified sequence can be used in the chimeric virus of the invention. The chimeric virus is a chimeric SIV-HIV virus (SHIV) that infects macaque monkeys and causes them to develop AIDS-associated symptoms within 32 weeks, where the virus is generated by at least two passages of a SHIV containing DNA encoding HIV env protein through macaque bone marrow in vivo. The monkeys are useful as an animal

                                                                                                                                                                                                                                                                                     A primer used in conjunction with primer AR6B (AAQ8755B) to generate an inactive asymmetric ribozyme which lacks a nucleotide at position 12 of activity of the asymmetric ribozyme is used as a control for the asymmetric ribozyme alpha-Y-R2195 (AAQ87567). The encoded ribozyme. This is an example of an asymmetric ribozyme construct of the RNA. The construct encodes the same after the sequence GUC in the target (AAQ87567) which cleaves the HILVIII RNA sequence GUC in the target asymmetric ribozyme construct encodes the asymmetric ribozyme construct asymmetric ribozyme to the HILVIII RNA sequence AAQ87565. The pathogenic RNA e.g. in viral or retrovital infection such as HIV
                                                                                                                                                                                                                                                                                 Sequence 32 BP; 6
                                                                                                                                                                                                             25

The amplified fragment was used to replace the helix I CC sequence of construct pas29-Ral2 AAAQ89745). This primer generates a CC construct in which a base is deleted from the catalytic domain and thus CC and cleaves after the ribozyme (alpha)r-Ral9s (AAQ8974), which the process the ribozyme (alpha)r-Ral9s (AAQ8974), which targets a CC and cleaves after the GC sequence at pos. 6048-50 of the HTV-III RNA CC asymmetric ribozyme construct was used in the generation of an anorthened helix I sequence. The ribozymes construct was used for the HTV-III RNA CC asymmetric ribozyme contain as ribozymes contain a contain the generation of an anorthened helix I sequence. The ribozymes constructed are constructed are constructed as cons

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             functional splice donor site (FSDS) and a functional splice acceptor site (FSAS) where: (1) the FSDS and the FSAS flank a first nucleotide sequence CC of interest (NOI); (il) the FSDS is upstream of the FSAS; (iii) the RVV cl is derived from a retroviral pro-vector; (iv) the retroviral pro-vector cc comprises a first nucleotide sequence (NS) capable of yielding the FSDS cand a second NS capable of yielding the FSAS; and (v) the first NS is comparises a for in vivo gene delivery, which system comprises a primary cc (VV) system for in vivo gene delivery, which system comprises a primary vector (VV) which encodes a secondary VV, the primary vector capable of infecting cc vector is capable of transducing a secondary VV, which secondary vv which secondary vv is obtainable from or is based on a adenoviral vector and the secondary vv is obtainable from or is based on a RVV preferably a cl entiviral vector (LVV) is also provided. The systems can be used for delivering NOIs to one or more target sites. The NOIs may encode concentration the system particularly for producing modified hematopoietic stem cells (MMSCS) to deliver NOIs to sites such as solid tumours, which are characterised by ischemia, such as hypoxia or low glucose concentration. The system permits the stable capacity is a stable capacity of the stable capacity is a targeted cells, e.g. rapidly dividing cells.

                                                                                                                                                                                                                                                                                                                                                                                                     Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The specification describes a method for labelling a nucleic acid molecule. The method comprises hybridising a first nucleic acid to a second nucleic cld, and extending the second nucleic acid with a DNA polymerase in the presence of a labelled nucleotide, to create a signal domain having a sequence which shows complementarity towards and is hybridisable to a signal template domain of the first nucleic acid, so that the second nucleic acid is labelled. The first nucleic acid comprises a substrate hybridisation domain of 5-20 nucleotides and a signal template domain of 5-100, from 3′ to 5′. The second nucleic acid comprises a template hybridisation domain of 5-20 which is not detectably labelled, and complementary to and hybridisable with the substrate hybridisation domain of the first nucleic acid, and a target binding domain which is not detectably labelled. The method is useful for labelling nucleic acids, so that a labelled complex of nucleic acid useful as probe is formed. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The specification describes a method for labelling a nucleic acid complete. The method comprises hybridising a first nucleic acid with a CC assecond nucleic cid, and extending the second nucleic acid with a CC DNA polymerase in the presence of a labelled nucleotide, to create a signal domain having a sequence which shows complementarity towards acid shybridisable to a signal template domain of the first nucleic acid, so that the second nucleic acid is a substrate hybridisation domain of 5-20 nucleic acid comprises a substrate hybridisation domain of 5-20 nucleic acid comprises a template hybridisation domain of 50 which is nucleic acid comprises a template hybridisation domain of 5-20 which is not detectably labelled, and complementary to and hybridisable cut in the substrate hybridisation domain of the first nucleic acid comprises a template hybridisation domain of 5-20 which is not detectably labelled. The method is useful for labelling nucleic acids, so that a labelled complex confidence is useful as probe is formed. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukaemia), diseases of the nervous system and an infection of pathogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interleukins, G-protein coupled receptors and thioesterases. The present sequence is one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of
                                                                                                                                                              New phospholipid hydroperoxide glutathione peroxidase, useful for manufacturing antioxidant cosmetic for preventing lipid and phospholipid modification due to peroxidation, leading to damage of the phospholipid modification due to peroxidation, leading to damage of the phospholipid modification due to peroxidation, leading to damage of the phospholipid modification due to peroxidation, leading to damage of the phospholipid modification due to peroxidation, leading to damage of the phospholipid modification due to peroxidation, leading to damage of the phospholipid modification due to peroxidation, leading to damage of the phospholipid modification due to peroxidation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pig; phosphollpid hydroperoxide glutathione peroxidase; PHGPx; Citrus stress-associated protein; Cit-SAP; antioxidant cosmetic; peroxidation; skin ageing; necrosis; skin lightening supporting
